

The `printfilelist` package*

Gorkem Aksaray
aksarayg@tcd.ie

v1.1.0 from 2026/06/06

Source repo: <https://github.com/gaksaray/printfilelist>.

1 Introduction

This is a $\text{\LaTeX}$ package for printing a list of the files used by the current document. It provides two commands, `\printfilelist` and `\ispackageloaded`, both of which can be used at any point within the document body, and needs nothing beyond the $\text{\LaTeX}$ kernel.

2 Usage

Load the package anywhere in the preamble:

```
\usepackage{printfilelist}
```

The load position does not matter: the package records every input file used by the document, and the two commands below read that list wherever they are called.

`\printfilelist[<filter>]` Prints the files used by the current document, one per line, together with their version information. The optional *<filter>* keeps only the files whose name contains the given text; for example,

```
\printfilelist[.sty]
```

lists only the `.sty` files. The default filter, `.`, keeps any file that has an extension, while an empty filter, `\printfilelist[]`, keeps every recorded file. If nothing matches, a short note is printed instead.

`\printfilelist*[<filter>]` The starred form prints a compact, comma-separated list of file names only, without version information. It is set as ordinary inline text, so it may be embedded in running prose, as in `Files: \printfilelist*[]`.

`\ispackageloaded{<package>}` Prints whether *<package>* is loaded, together with its version if so. The starred form, `\ispackageloaded*`, prints only “is loaded” or “is not loaded”. This command recognises packages (`.sty` files) only, not document classes.

*This document corresponds to `printfilelist` v1.1.0, dated 2026/06/06.

3 Notes

The package issues `\listfiles` when loaded; this is what makes the kernel keep the file list until the commands above are used. As a side effect, $\text{\LaTeX}$ also writes the file list to the `.log` at the end of the run. The package always omits its own entry, `printfilelist.sty`. The detailed form of `\printfilelist` forms its own paragraph, while the starred form is inline; neither is intended for a moving argument such as a section title.

4 Implementation

The kernel accumulates the names of all input files in `\@filelist`, but discards it at `\begin{document}` unless `\listfiles` has been issued. Issuing it here keeps the list available for the commands below.

```
1 \listfiles
```

`\ispackageloaded` The kernel records a loaded package in the control sequence `\ver@<name>.sty`. The unstarred form prints that version; the starred form reports only whether the package is present.

```
2 \newcommand{\ispackageloaded}{\@ifstar\pfl@ispl@star\pfl@ispl@plain}
3 \newcommand{\pfl@ispl@plain}[1]{%
4   \if\relax\detokenize{#1}\relax\else
5     \ifcsname ver@#1.sty\endcsname
6       \texttt{#1.sty}: \csname ver@#1.sty\endcsname%
7     \else
8       \texttt{#1} is not loaded%
9     \fi
10  \fi
11 }
12 \newcommand{\pfl@ispl@star}[1]{%
13   \if\relax\detokenize{#1}\relax\else
14     \ifcsname ver@#1.sty\endcsname
15       \texttt{#1} is loaded%
16     \else
17       \texttt{#1} is not loaded%
18     \fi
19   \fi
20 }
```

`\printfilelist` The star selects the compact, inline form; without it, the detailed one-per-line listing is produced. Either way the list is read live from `\@filelist` when the command is called.

```
21 \newif\ifpfl@inline
22 \newif\ifpfl@found
23 \newcommand{\printfilelist}{\@ifstar{\pfl@inlinetrue\pfl@run}{\pfl@inlinefalse\pfl@run}}
24 \newcommand{\pfl@run}[1][.]{%
25   \begingroup
26   \ifpfl@inline\else\par\fi
27   \pfl@foundfalse
```

```

28 \for\pfl@file:=\@filelist\do{%
29     \expandafter\pfl@test\expandafter{\pfl@file}{#1}%
30 }%
31 \ifpfl@found\else
32     \ifpfl@inline\pfl@nomatch\else\noindent\pfl@nomatch\par\fi
33 \fi
34 \ifpfl@inline\else\par\fi
35 \endgroup
36 }

```

The message shown when nothing matches the filter; redefine it to change the wording. Its framing (inline or paragraph) is supplied by `\pfl@run`.

```

37 \newcommand{\pfl@nomatch}{\textit{No matching files.}}

```

Each recorded file is tested against the filter, and the package's own file is always skipped. Matching uses the kernel's `\in@`, which compares tokens literally and does not expand its arguments, so the name held in `\pfl@file` is expanded into the test with `\expandafter`.

```

38 \newcommand{\pfl@test}[2]{%
39     \in@{printfilelist.sty}{#1}%
40     \ifin@else
41         \if\relax\detokenize{#2}\relax
42             \pfl@printline
43         \else
44             \in@{#2}{#1}%
45             \ifin@\pfl@printline\fi
46         \fi
47     \fi
48 }

```

This prints one entry: in the compact form a comma precedes every entry except the first (tracked by `\ifpfl@found`), while in the detailed form the name is followed by its version, if any, on its own line.

```

49 \newcommand{\pfl@printline}{%
50     \ifpfl@inline
51         \ifpfl@found,\space\fi
52         \pfl@foundtrue
53         \texttt{\pfl@file}%
54     \else
55         \pfl@foundtrue
56         \noindent\texttt{\pfl@file}%
57         \ifcsname ver@\pfl@file\endcsname
58             : \csname ver@\pfl@file\endcsname%
59         \fi
60     \par
61 \fi
62 }

```

Change History

v1.0.0	
General: Initial version	1
v1.1.0	
General: Rewritten to use only the LaTeX kernel, removing the xstring and suffix dependencies; the file list is now read live so the package	may be loaded anywhere in the preamble; the starred form prints a compact, inline, comma-separated list of names; a note is printed when no file matches the filter; removed the internal file-list alias
	1
